1. PDB

Today we will be exploring the PDB data base found at: http://www.rcsb.org/

I accessed my data using"Analyze" > "PDB Statistics" > "by Experimental Method and Molecular Type"

> Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
pdbstats = read.csv("Data Export Summary.csv")
pdbstats$X.ray
```

```
[1] "169,563" "9,939"   "8,801"   "2,890"   "170"     "11"
```

The comma in these numbers is causing them to be read as character rather than numeric

I can fix this by "," for nothing with " " with the `sub()` function

```
x = pdbstats$X.ray
sum(as.numeric(sub(",","",x)))
```

```
[1] 191374
```

Or I an use the **readr** package and the `read_csv()` function.

```
library(readr)

pdbstats = read_csv("Data Export Summary.csv")
```

```

I want to clean the column names so that they are all lower case and don't have spaces in them

```

The following objects are masked from 'package:stats':

    chisq.test, fisher.test
```

```
df = clean_names(pdbstats)

2. Using Mol*

The main Mol* homepage at: https://molstar.org//viewer/ We can input our own PDB files or just gie it a PDB database accession code (4 letter PDB code)

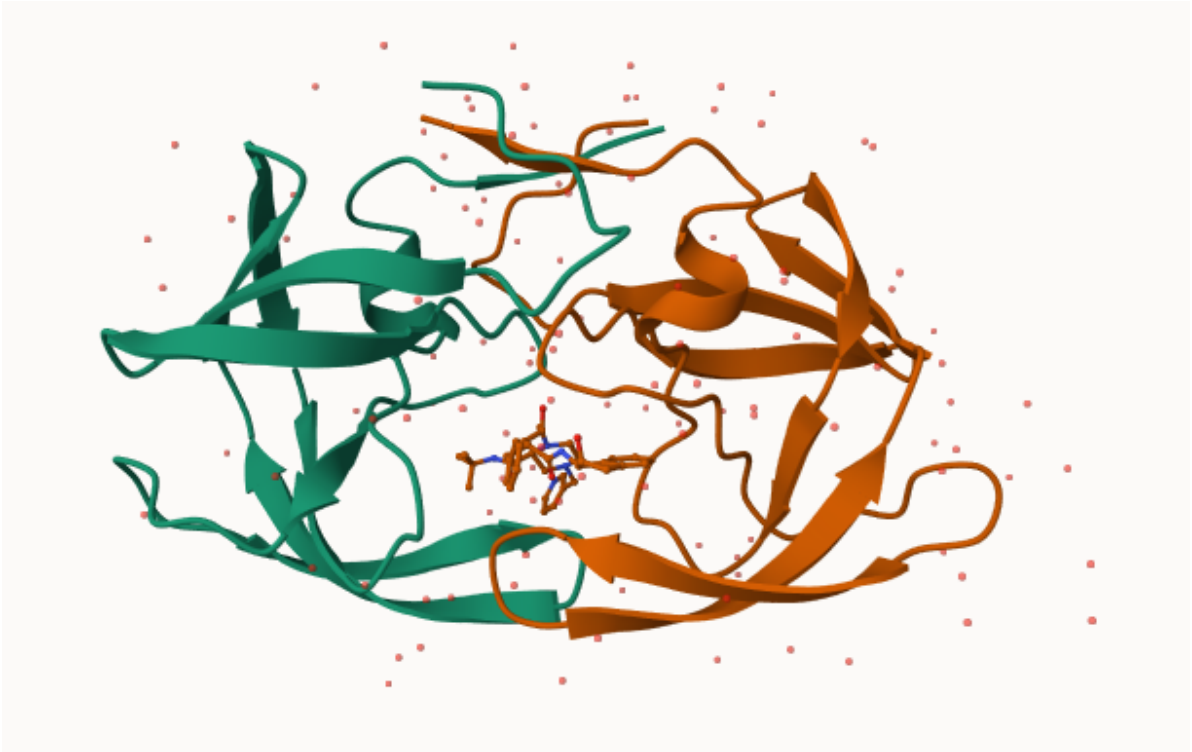

Figure 1: Molecular view of 1HSG

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

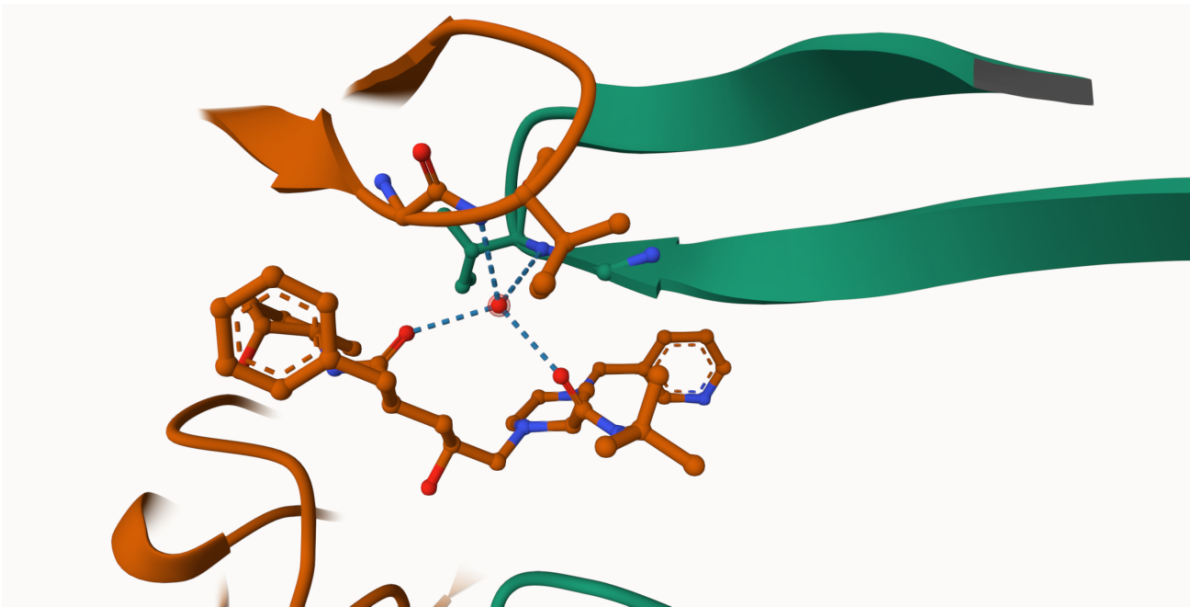

Figure 2: Water 308 in binding site

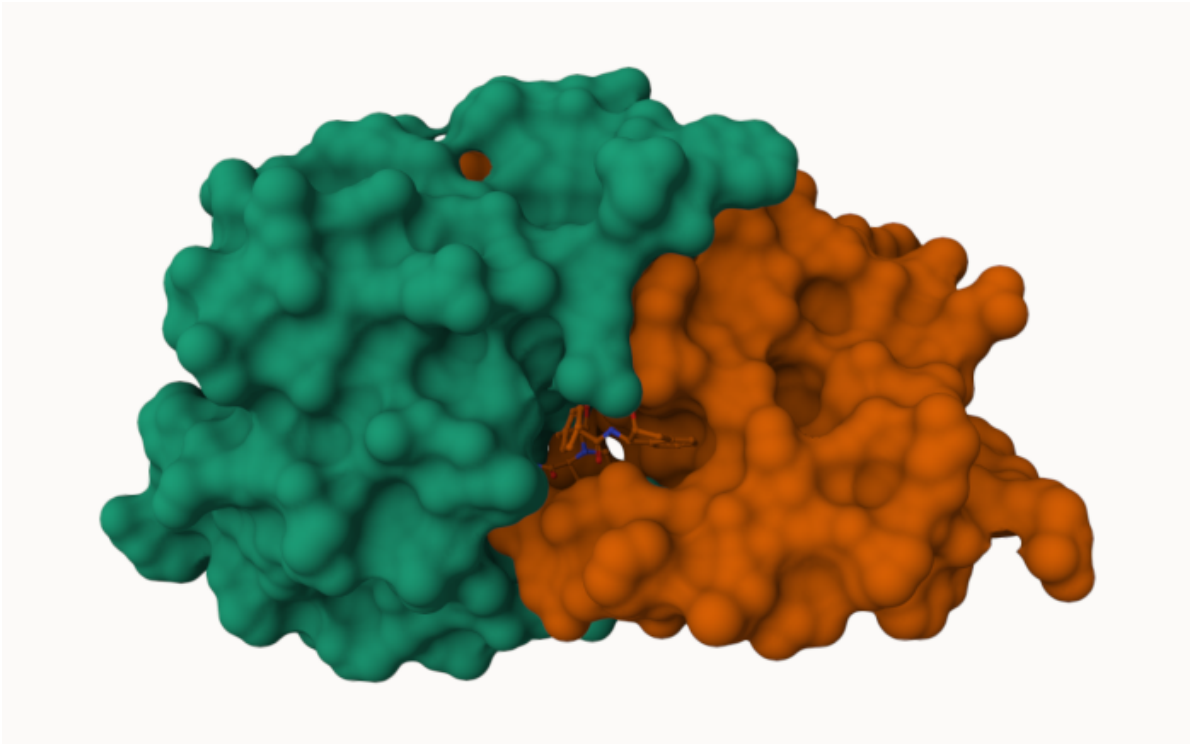

Figure 3: Molecular surface view of binding cavity

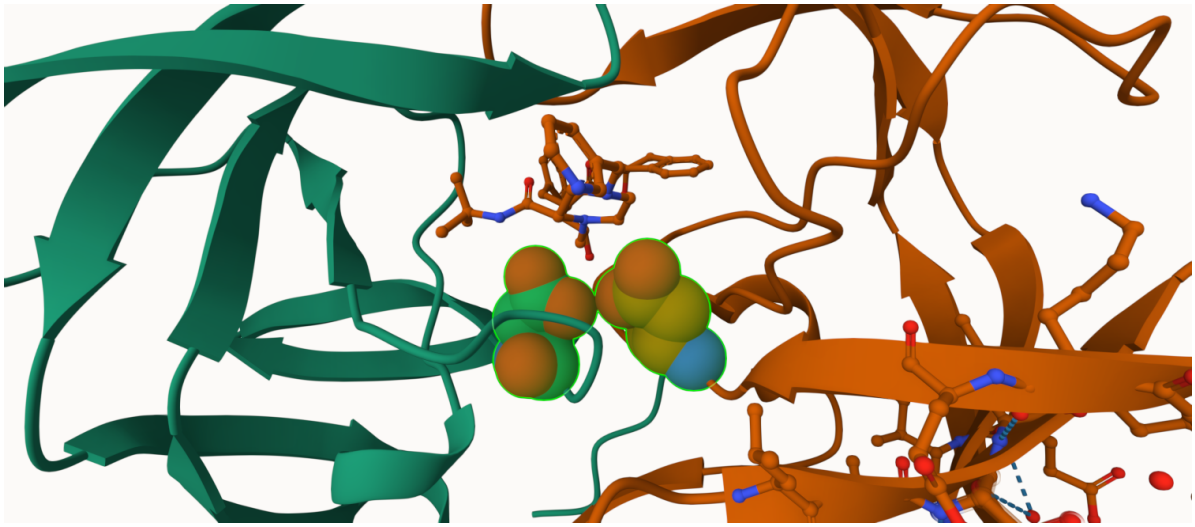

Figure 4: The important Asp used in binding

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure? We see one atom per water molecule because they would create a big block otherwise due to how they interact with the protein.

3. Introduction to Bio3D in R

We can use the **bio3d** package for structural bioinformatics to read PDB data into R

```
library(bio3d)

pdb = read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

        calpha, remark, call
```

Q7: How many amino acid residues are there in this pdb object?

```
length(pdbseq(pdb))
```

```
[1] 198
```

Q8: Name one of the two non-protein residues? HOH

Q9: How many protein chains are in this structure? There are 2 chains A and B

Looking at the `pdb` object in more detail

Let's try a new funciton not yet in the bio3d package. It requires the **r3dmol** package that we nee ot install with `install.packages("r3dmol")` and `install.packages("shiny")`.

```

4. Predicting Functional Dynamics

We can use the `nma()` function in bio3d to predict the large-scale functional motions of biomolecules.

```
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk
```

```
 Call:  read.pdb(file = "6s36")

     Protein Atoms#: 1654  (residues/Calpha atoms#: 214)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 244  (residues: 244)
     Non-protein/nucleic resid values: [ CL (3), HOH (238), MG (2), NA (1) ]
