Lab 9- Halloween Candy Mini Project

Trevor Hoang (A16371830)

Table of contents

Today we will examine data from 538 on common Halloween candy. In particular we will use ggplot, dplyr and PCA to make sense of this multivariate dataset.

Importing Candy Data

```
candy = read.csv("candy-data.csv", row.names=1)

head(candy)
```

```
             chocolate fruity caramel peanutyalmondy nougat crispedricewafer
100 Grand            1      0       1              0      0                 1
3 Musketeers         1      0       0              0      1                 0
One dime             0      0       0              0      0                 0
One quarter          0      0       0              0      0                 0
Air Heads            0      1       0              0      0                 0
Almond Joy           1      0       0              1      0                 0
             hard bar pluribus sugarpercent pricepercent winpercent
100 Grand       0   1        0        0.732        0.860   66.97173
3 Musketeers    0   1        0        0.604        0.511   67.60294
```

```
One dime            0   0         0         0.011         0.116   32.26109
One quarter         0   0         0         0.011         0.511   46.11650
Air Heads           0   0         0         0.906         0.511   52.34146
Almond Joy          0   1         0         0.465         0.767   50.34755
```

Q1. How many different candy types are in this dataset?

```
nrow(candy)
```

```
[1] 85
```

Q2. How many fruity candy types are in the dataset?

```
sum(candy$fruity)
```

```
[1] 38
```

How many chocolate chandy are there in this dataset?

```
sum(candy$chocolate)
```

```
[1] 37
```

Favorite Candy

Finding the favorite candy by percentage using the winpercent statistic

Q3. What is your favorite candy in the dataset and what is it's winpercent value?

```
candy["Nerds", "winpercent"]
```

```
[1] 55.35405
```

Q4. What is the winpercent value for "Kit Kat"?

```
candy["Kit Kat", "winpercent"]
```

```
[1] 76.7686
```

Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?

```
candy["Tootsie Roll Snack Bars", "winpercent"]
```

```
[1] 49.6535
```

Using skimr

```
library(skimr)
skim(candy)
```

Table 1: Data summary

Name	candy
Number of rows	85
Number of columns	12
_____	
Column type frequency:	
numeric	12
_____	
Group variables	None

Variable type: numeric

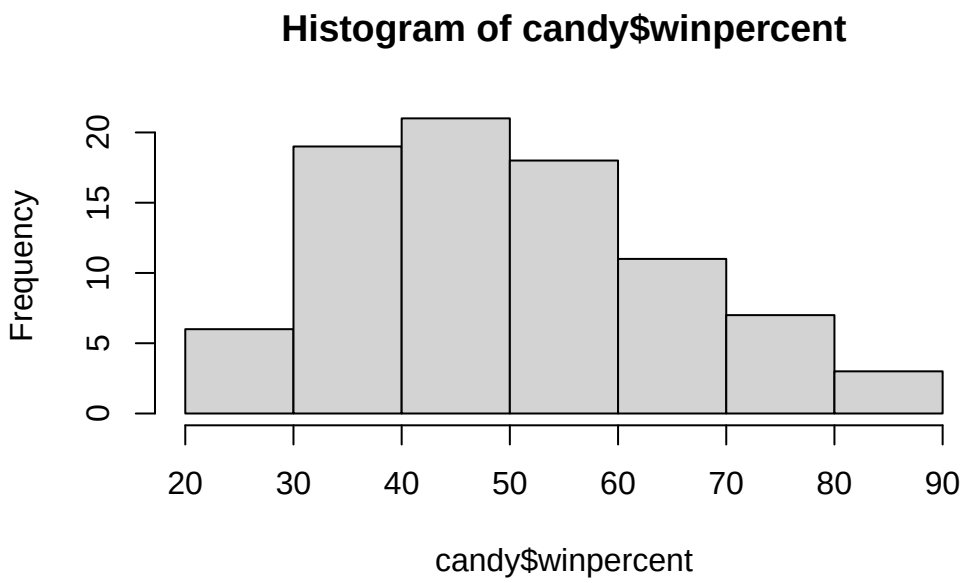
skim_variable	n_missing	complete_rate	mean	sd	p0	p25	p50	p75	p100	hist
chocolate	0	1	0.44	0.50	0.00	0.00	0.00	1.00	1.00	
fruity	0	1	0.45	0.50	0.00	0.00	0.00	1.00	1.00	
caramel	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
peanutyalmondy	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
nougat	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
crispedricewafer	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
hard	0	1	0.18	0.38	0.00	0.00	0.00	0.00	1.00	
bar	0	1	0.25	0.43	0.00	0.00	0.00	0.00	1.00	
pluribus	0	1	0.52	0.50	0.00	0.00	1.00	1.00	1.00	
sugarpercent	0	1	0.48	0.28	0.01	0.22	0.47	0.73	0.99	
pricepercent	0	1	0.47	0.29	0.01	0.26	0.47	0.65	0.98	
winpercent	0	1	50.32	14.71	22.45	39.14	47.83	59.86	84.18	

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset? It looks like the `winpercent` column is on a different scale that the others (0-100% rather than 0-1). I will need to scale this dataset before analysis like PCA

Q7. What do you think a zero and one represent for the candy$chocolate column? I think that a 1 represents the candy being considered a chocolate while a 0 means that it is not considered a chocolate.

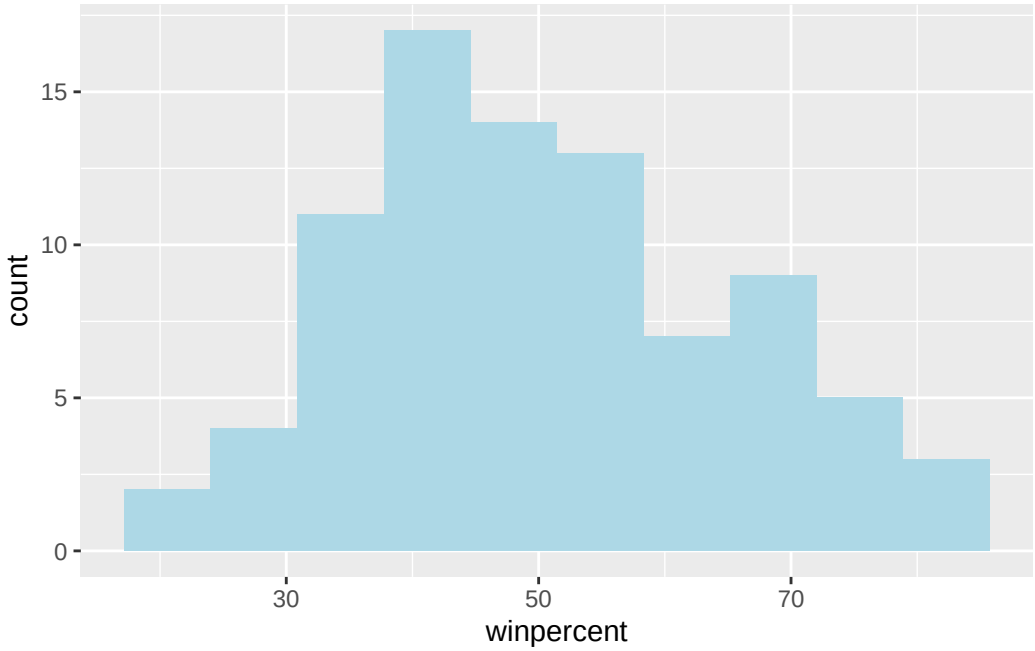
Q8. Plot a histogram of winpercent values

```
hist(candy$winpercent)
```



```
library(ggplot2)

ggplot(candy)+
  aes(winpercent)+
  geom_histogram(bins=10, fill="lightblue")
```



Q9. Is the distribution of winpercent values symmetrical? No it looks like the histogram is skewed left

Q10. Is the center of the distribution above or below 50%? The center of the distribution is slightly below 50%

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

- Step 1: Find all "chocolate" candy
- Step 2: Find their "winpercent" values
- Step 3: Summarize these values
- Step 4: Find all "Fruity" candy
- Step 5: FInd their "winpercent" values
- Step 6: Summarize thee values
- Step 7: Compare the 2 summary values

Step 1: Find all chocolate candy

```
choc.inds = candy$chocolate == 1
```

Step 2: Find their winpercent values

```
choc.win = candy[choc.inds,]$winpercent
```

Step 3: Summarize these values

```
choc.mean = mean(choc.win)
```

Step 4: Find all "Fruity" candy

```
fruity.inds = candy$fruity == 1
```

Step 5: FInd their "winpercent" values

```
fruity.wins = candy[fruity.inds,]$winpercent
```

Step 6: Summarize thee values

```
fruit.mean = mean(fruity.wins)
```

Step 7: Compare the 2 summary values Chocolate has the higher mean

```
choc.mean
```

```
[1] 60.92153
```

```
fruit.mean
```

```
[1] 44.11974
```

Q12. Is this difference statistically significant?

```
t.test(choc.win, fruity.wins)
```

```
    Welch Two Sample t-test

data:  choc.win and fruity.wins
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

Overall Candy Rankings

Q13. What are the five least liked candy types in this set?

```
#Sort is not that useful - it just sorts values
sort(candy$winpercent)
```

```
 [1] 22.44534 23.41782 24.52499 27.30386 28.12744 29.70369 32.23100 32.26109
 [9] 33.43755 34.15896 34.51768 34.57899 34.72200 35.29076 36.01763 37.34852
[17] 37.72234 37.88719 38.01096 38.97504 39.01190 39.14106 39.18550 39.44680
[25] 39.46056 41.26551 41.38956 41.90431 42.17877 42.27208 42.84914 43.06890
[33] 43.08892 44.37552 45.46628 45.73675 45.99583 46.11650 46.29660 46.41172
[41] 46.78335 47.17323 47.82975 48.98265 49.52411 49.65350 50.34755 51.41243
[49] 52.34146 52.82595 52.91139 54.52645 54.86111 55.06407 55.10370 55.35405
[57] 55.37545 56.49050 56.91455 57.11974 57.21925 59.23612 59.52925 59.86400
[65] 60.80070 62.28448 63.08514 64.35334 65.71629 66.47068 66.57458 66.97173
[73] 67.03763 67.60294 69.48379 70.73564 71.46505 72.88790 73.09956 73.43499
[81] 76.67378 76.76860 81.64291 81.86626 84.18029
```

```
x = c(10, 1, 100)
order(x)
```

```
[1] 2 1 3
```

```
x[order(x)]
```

```
[1]   1  10 100
```

The `order()` function tells us how to arrange the elements of the input to make them sortable - i.e. how to order them

We can determine the order to winpercent to make them sorted and use that order to arrange the whole dataset.

```
ord.inds = order(candy$winpercent)
head(candy[ord.inds,])
```

```
                  chocolate fruity caramel peanutyalmondy nougat

```

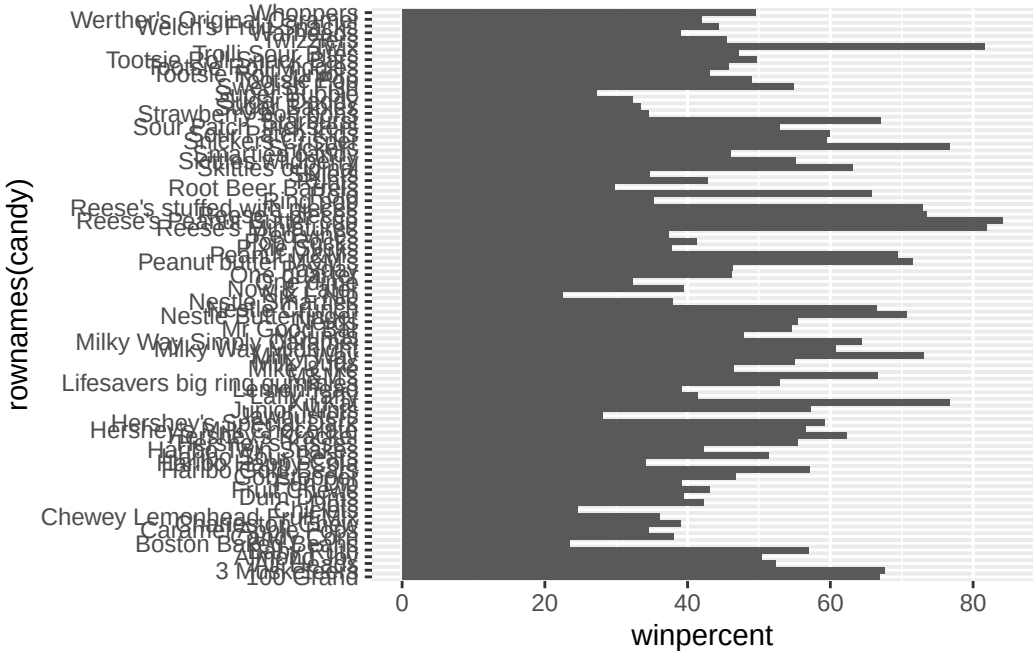
Q15. Make a first barplot of candy ranking based on winpercent values.

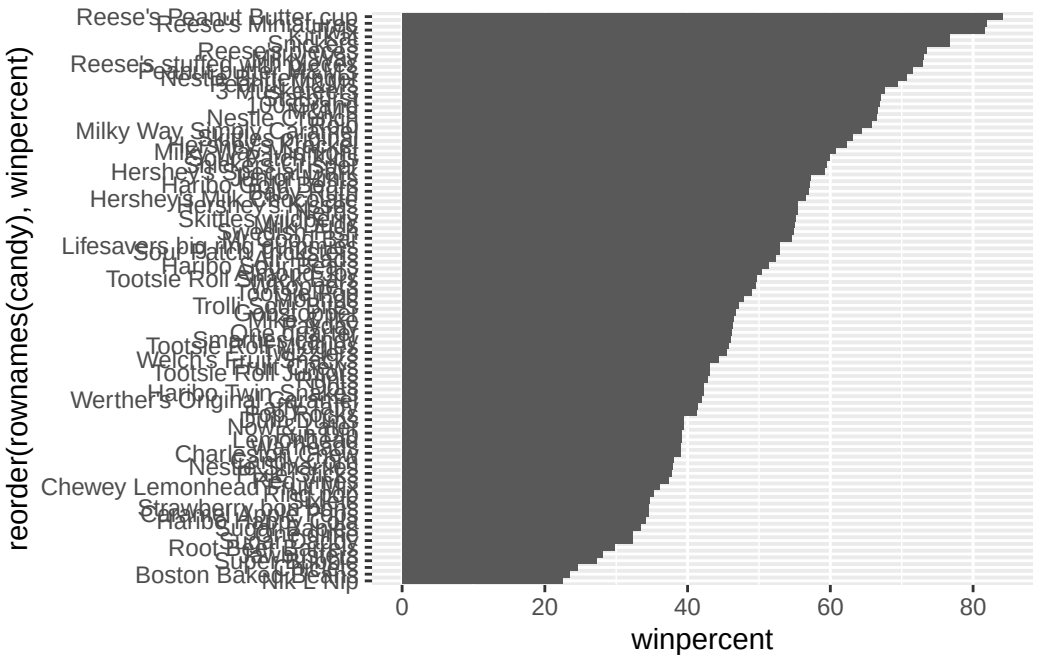
```
ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```



Q16. This is quite ugly, use the reorder() function to get the bars sorted by winpercent?

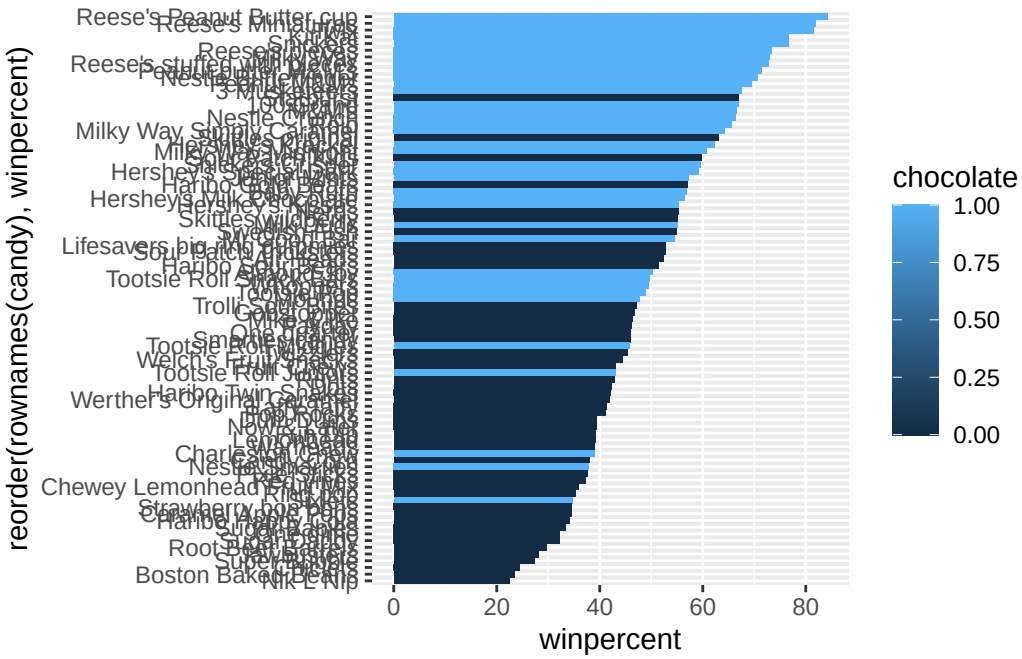
Let's rearrange these

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col()
```



Time to add some color

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent), fill=chocolate) +
  geom_col()
```



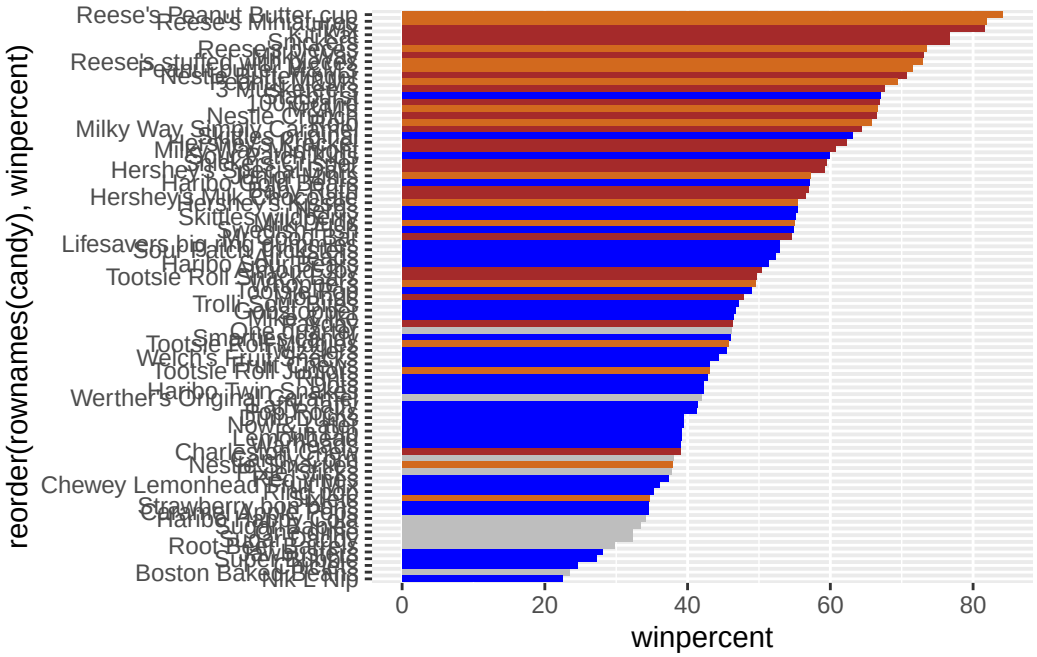
Need to make our own separate color vector where we can spell out exactly what candy is colored a particular color.

```
mycols = rep("gray", nrow(candy))
mycols[candy$chocolate == 1] = "chocolate"
mycols[candy$bar == 1] = "brown"
mycols[candy$fruity == 1] = "blue"
mycols
```

```
 [1] "brown"     "brown"     "gray"      "gray"      "blue"      "brown"
 [7] "brown"     "gray"      "gray"      "blue"      "brown"     "blue"
[13] "blue"      "blue"      "blue"      "blue"      "blue"      "blue"
[19] "blue"      "gray"      "blue"      "blue"      "chocolate" "brown"
[25] "brown"     "brown"     "blue"      "chocolate" "brown"     "blue"
[31] "blue"      "blue"      "chocolate" "chocolate" "blue"      "chocolate"
[37] "brown"     "brown"     "brown"     "brown"     "brown"     "blue"
[43] "brown"     "brown"     "blue"      "blue"      "brown"     "chocolate"
[49] "gray"      "blue"      "blue"      "chocolate" "chocolate" "chocolate"
[55] "chocolate" "blue"      "chocolate" "gray"      "blue"      "chocolate"
[61] "blue"      "blue"      "chocolate" "blue"      "brown"     "brown"
[67] "blue"      "blue"      "blue"      "blue"      "gray"      "gray"
[73] "blue"      "blue"      "blue"      "chocolate" "chocolate" "brown"
[79] "blue"      "brown"     "blue"      "blue"      "blue"      "gray"
```

```
[85] "chocolate"
```

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col(fill=mycols)
```



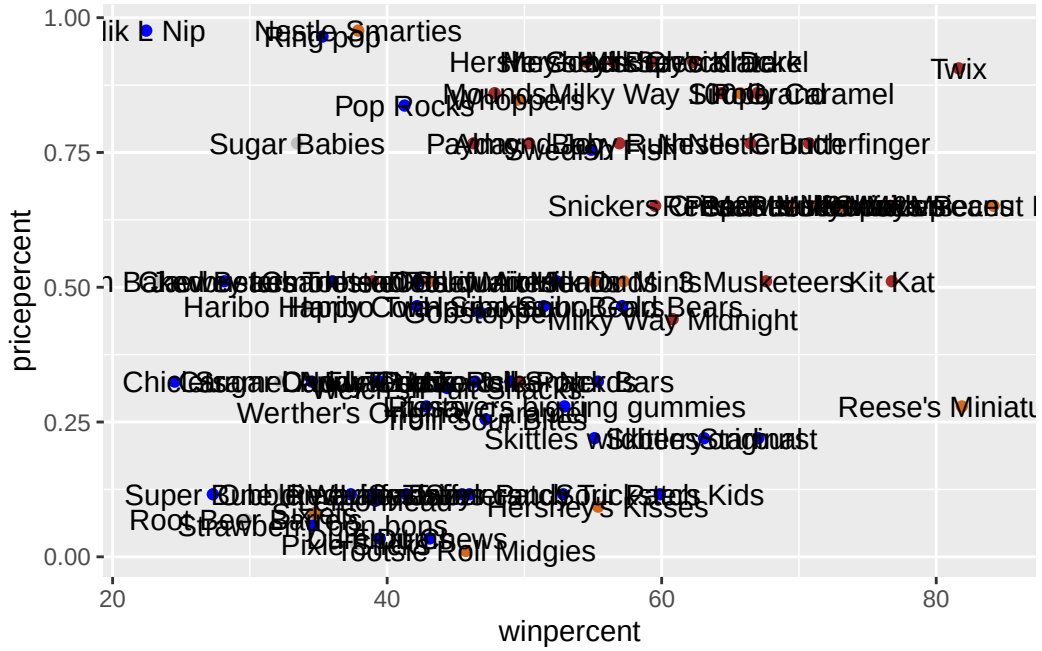
Q17. What is the worst ranked chocolate candy? The worst ranked chocolate candy is sixlet

Q18. What is the best ranked fruity candy? The best ranked fruity candy is starburts

Taking a look at price percent

Make a plot of winpercent (x-axis) vs pricepercent (y-axis)

```
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=mycols) +
  geom_text()
```

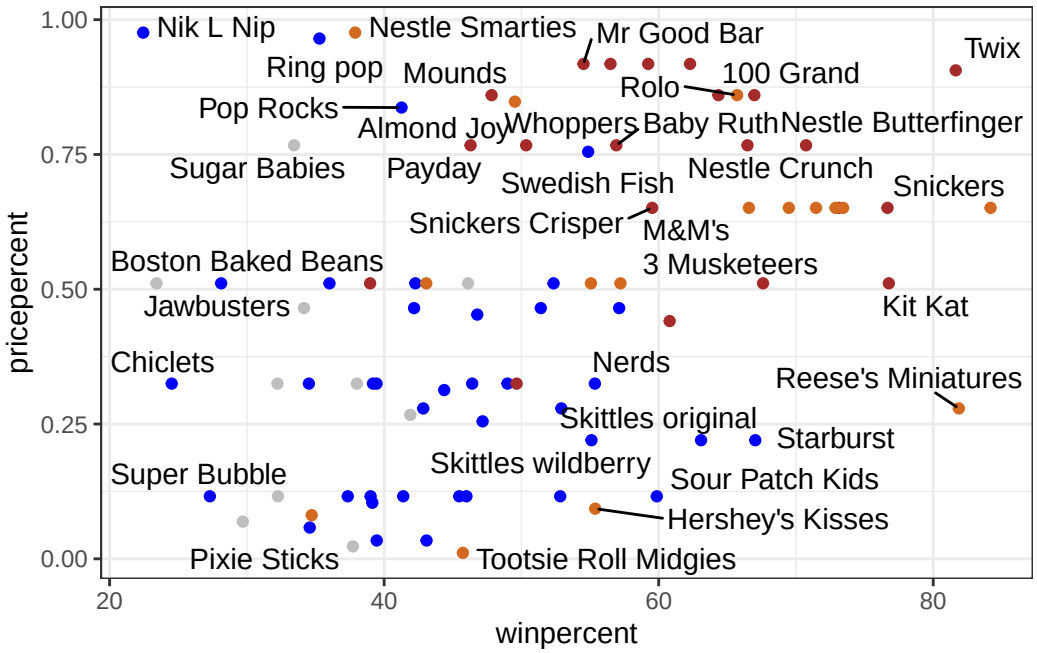


To avoid the overplotting of the text labels we can use the add on package **ggrepel**

```
library(ggrepel)

ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=mycols) +
  geom_text_repel(max.overlaps=10) +
  theme_bw()
```

```
Warning: ggrepel: 50 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



Q19. Which candy type is the highest ranked in terms of winpercent for the least money - i.e. offers the most bang for your buck? The highest ranked candy with for the least money is reese's miniatures

Q20. What are the top 5 most expensive candy types in the dataset and of these which is the least popular?

```
ord.inds = order(candy$pricepercent, decreasing =T)
head(candy[ord.inds,])
```

```
                        chocolate fruity caramel peanutyalmondy nougat

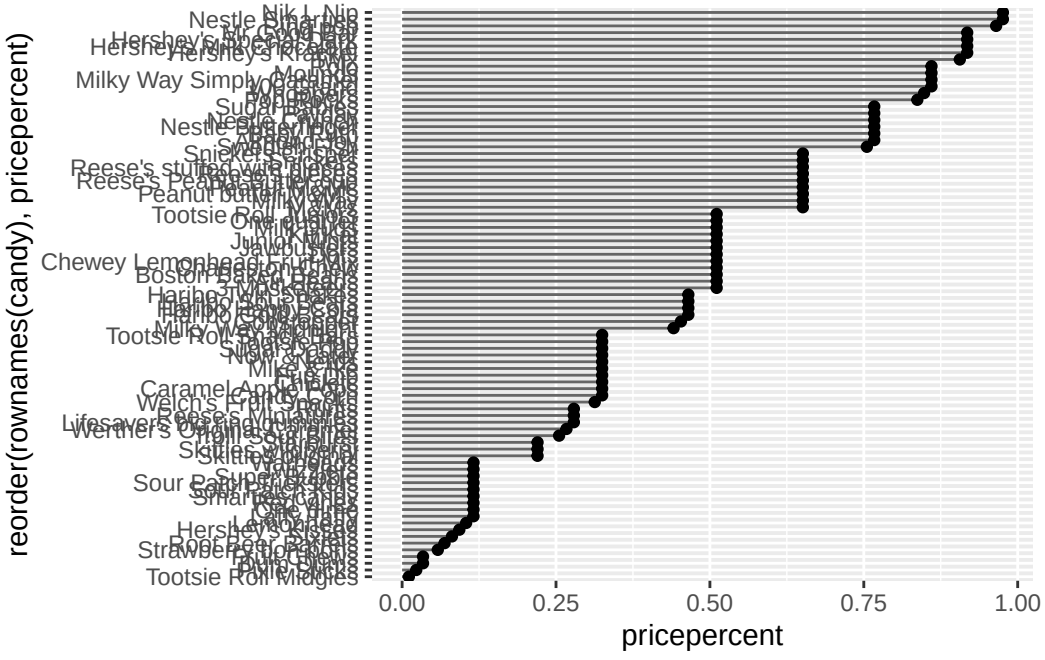
Hershey's Special Dark          1      0       0              0      0
                        crispedricewafer hard bar pluribus sugarpercent
Nik L Nip                              0    0   0        1        0.197
Nestle Smarties                        0    0   0        1        0.267
Ring pop                               0    1   0        0        0.732
Hershey's Krackel                      1    0   1        0        0.430
Hershey's Milk Chocolate               0    0   1        0        0.430
```

```
Hershey's Special Dark                    0    0   1         0         0.430
                         pricepercent winpercent
Nik L Nip                       0.976   22.44534
Nestle Smarties                 0.976   37.88719
Ring pop                        0.965   35.29076
Hershey's Krackel               0.918   62.28448
Hershey's Milk Chocolate        0.918   56.49050
Hershey's Special Dark          0.918   59.23612
```

Nik L Nip is the least popular

Q21. Make a barplot again with geom_col() this time using pricepercent and then improve this step by step, first ordering the x-axis by value and finally making a so called "dot chat" or "lollipop" chart by swapping geom_col() for geom_point() + geom_segment().

```
ggplot(candy) +
  aes(pricepercent, reorder(rownames(candy), pricepercent)) +
  geom_segment(aes(yend = reorder(rownames(candy), pricepercent),
                   xend = 0), col="gray40") +
    geom_point()
```



Exploring the correlation structure

Now that we have explored the dataset a little, we will see how the variables interact with one another.

First we will use correlation and view the results with the **corrplot** package to plot a correlation matrix

```
cij = cor(candy)
cij
```

```
                  chocolate      fruity     caramel peanutyalmondy      nougat

```
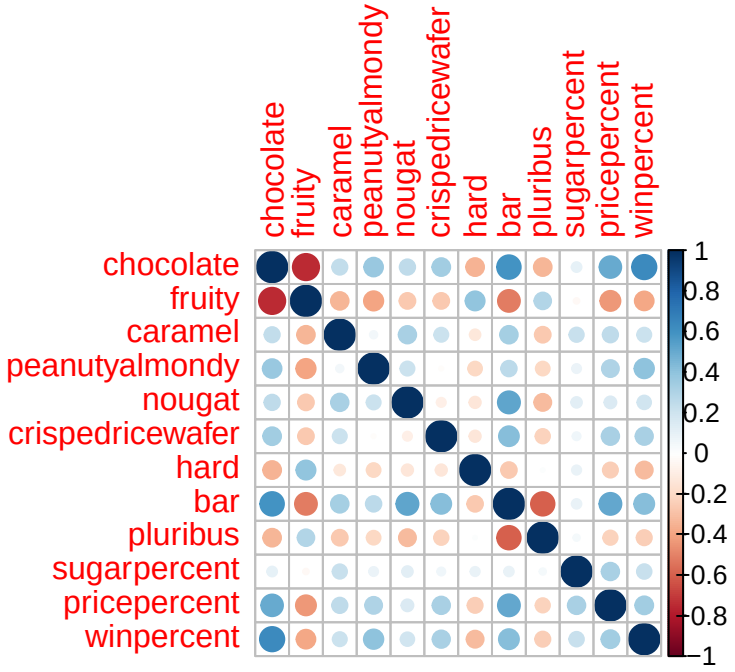
corrplot 0.95 loaded
```

```
corrplot(cij)
```



Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)? Chocolate and fruit are anti-correlated

Q23. Similarly, what two variables are most positively correlated? Chocolate and bar are positively correlated

Principal Component Analysis

Let's apply PCA using the `prcom()` function to our candy dataset remembering to set the **scale=TRUE** argument.

```
pca = prcomp(candy, scale=T)

summary(pca)
```

```
Importance of components:
                          PC1    PC2    PC3     PC4    PC5     PC6     PC7
Standard deviation     2.0788 1.1378 1.1092 1.07533 0.9518 0.81923 0.81530
Proportion of Variance 0.3601 0.1079 0.1025 0.09636 0.0755 0.05593 0.05539
Cumulative Proportion  0.3601 0.4680 0.5705 0.66688 0.7424 0.79830 0.85369
                           PC8     PC9    PC10    PC11    PC12
Standard deviation     0.74530 0.67824 0.62349 0.43974 0.39760
Proportion of Variance 0.04629 0.03833 0.03239 0.01611 0.01317
Cumulative Proportion  0.89998 0.93832 0.97071 0.98683 1.00000
```

```
attributes(pca)
```

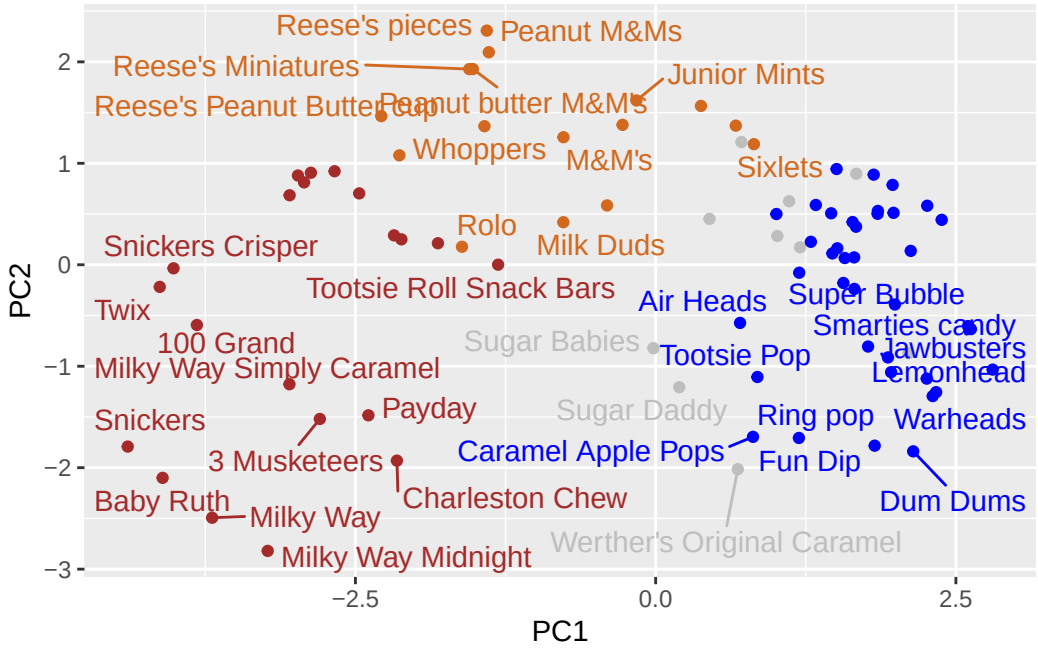
```
$names
[1] "sdev"     "rotation" "center"   "scale"    "x"

$class
[1] "prcomp"
```

Let's plot our main results as our PCA "score plot"

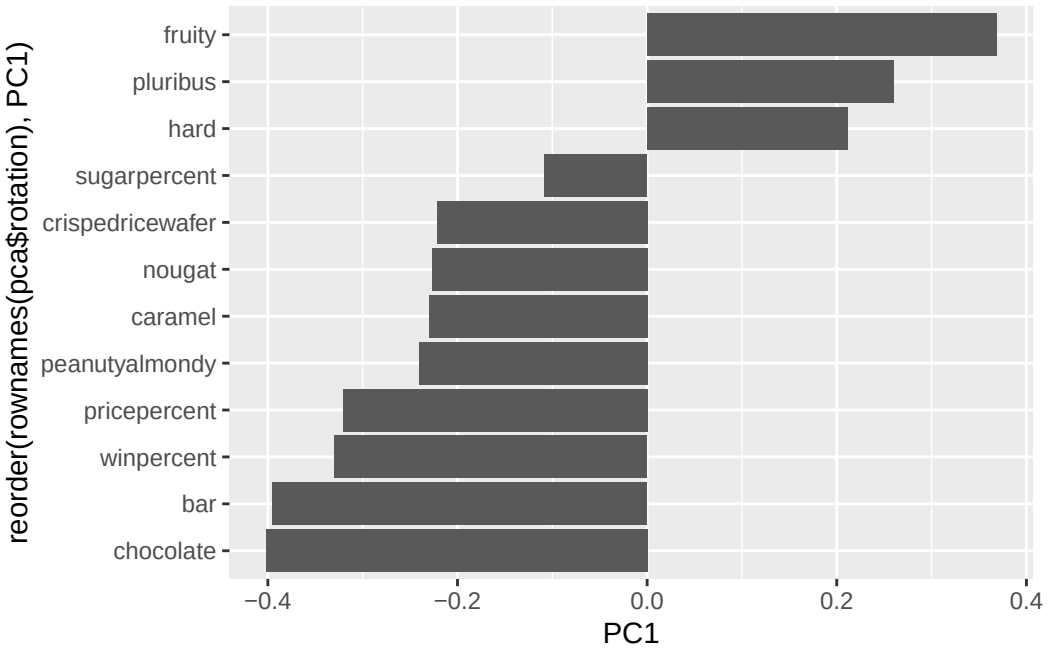
```
ggplot(pca$x) +
  aes(PC1, PC2, label=rownames(pca$x)) +
  geom_point(col=mycols) +
  geom_text_repel(col=mycols)
```

```
Warning: ggrepel: 48 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



Finally let's look athow the original variables contribute to the PC's, start with PC1

```
ggplot(pca$rotation) +
  aes(PC1, reorder(rownames(pca$rotation),PC1))+
  geom_col()
```



Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you? Fruitym pluribus and hard were strongly in the positive direction. This makes sense because they are generally correlated with one another.
